

# Quantum Theory of Light (WS19/20)

matthias.kleinmann@uni-siegen.de

## Table of Contents

### Introduction

### I Quantization of the electromagnetic field

- 1) ... in a cavity
- 2) ... in free space

### II Coherent states

- 1) Radiation from a classical current
- 2) Properties of coherent states
- 3) Squeezed states
- 4) Representation of states using coherent states

### III Quantum interference

- 1) Coherence
- 2) Interference and beam splitters

### IV Light and atoms

- 1) Coupling to a classical field
- 2) Coupling to a quantized field
- 3) Spontaneous emission

### V Open quantum systems

- 1) Quantum mechanics of subsystems
- 2) Dynamics for density operators: General case
- 3) Microscopic derivation of the Lindblad master equation
- 4) Application to quantum optics
